

Lab 5: dplyr, Part 2

Row-wise maxima, across(), case_when(), and row names.

Work in a **Quarto** document. Do **5.1** and **5.2** first. `starwars` comes with dplyr.

```
library(tidyverse)
```

1. Row-wise and across

1. For each `starwars` character, the maximum of `height`, `mass`, and `birth_year` (`na.rm = TRUE`). Who is largest? Run it with `rowwise()` and once without.
2. Median of every numeric column, by `species` and `gender`, plus `n()`, sorted by `n` descending.
3. Min and max of every numeric column except `birth_year`, by `species` and `gender`, plus `n()`.

2. case_when and row names

1. Add a `type` column to `starwars`: "large" if height or mass is over 200, "robot" if the species is Droid, otherwise "other".
2. Does `mtcars` have row names? If so, make a tibble with a `car` column.
3. Distinct combinations of the `starwars` columns whose names contain "color".
